## 6 FACTORS OF TRINOMIAL

A trinomial is an algebraic expression made up of three terms. When factoring trinomials that are in the form of  $ax^2 + bx + c = 0$ , the following steps are followed :

1. See if the coefficient  $a$ ,  $b$  and  $c$  all have any common factors that you can factor out.
2. Multiply  $a$  and  $c$  and list out all of the factor pairs of the product.
3. Calculate the sum of the pair of factors which are equal to  $b$ .
4. In the original equation, write  $bx$  in terms of the sums of the factors you choose.
5. Group the first two terms together in a set of parenthesis and the second two terms together in a set of separate parenthesis and factor out the greatest common factor for each set of parenthesis.
6. Add the terms that you factored out of the parenthesis and multiply by the parenthesis that has a match.
7. To solve the trinomial, set terms in each parenthesis equal to 0 and solve for  $x$ .

**Example 10 : Factorize  $x^4 - 25$**

Solution : 
$$\begin{aligned} (x^4 - 25) &= (x^2)^2 - (5)^2 \\ &= (x^2 + 5)(x^2 - 5) \\ &\quad [\because (a^2 - b^2) = (a + b)(a - b)] \end{aligned}$$

**Example 11 : Factorize  $8x^3 - 64y^3$**

Solution : 
$$\begin{aligned} 8x^3 - 64y^3 &= (2x)^3 - (4y)^3 \\ &= (2x - 4y)((2x)^2 + (4y)^2) \\ &\quad + (2x)(4y) \\ &\quad [\because a^3 - b^3 = (a - b)(a^2 + ab + b^2)] \\ &= (2x - 4y)(4x^2 + 16y^2 + 8xy) \end{aligned}$$

**Example 12 : Factorize  $x^2 + 13x + 40$**

Solution : 
$$\begin{aligned} x^2 + 13x + 40 &= x^2 + 8x + 5x + 40 \\ &= x(x + 8) + 5(x + 8) \\ &= (x + 5)(x + 8) \quad \text{Ans.} \end{aligned}$$

**Example 14 : Factorize  $8x^3 - 125$**

Solution : 
$$\begin{aligned} 8x^3 - 125 &= (2x)^3 - (5)^3 \\ &= (2x - 5)[(2x)^2 + (5)^2 + (2x)(5)] \\ &\quad [\because a^3 - b^3 = (a - b)(a^2 + b^2 + ab)] \\ &= (2x - 5)[4x^2 + 25 + 10x] \\ &= (2x - 5)(4x^2 + 10x + 25) \quad \text{Ans.} \end{aligned}$$

**Example 15 : Factorize  $x^8 - y^8$**

Solution : 
$$\begin{aligned} (x^8 - y^8) &= (x^4)^2 - (y^4)^2 \\ &= (x^4 + y^4)(x^4 - y^4) \\ &\quad [\because a^2 - b^2 = (a + b)(a - b)] \\ &= (x^4 + y^4)[(x^2)^2 - (y^2)^2] \\ &= (x^4 + y^4)(x^2 + y^2)(x^2 - y^2) \\ &= (x^4 + y^4)(x^2 + y^2)[(x)^2 - (y)^2] \\ &= (x^4 + y^4)(x^2 + y^2)(x + y)(x - y) \quad \text{Ans.} \end{aligned}$$
